

Dashboard

We knew it was imperative to keep all the data on the dashboard where it was all visible at all times, but still have the ability to hone into different components.

The goal was to increase the velocity of the users in the dashboard by displaying the bottom line that will lead to a faster, stronger conclusion. Yet have the flexibility to allow exploration of the data for further analysis.

Main Graph

The goal here was to create a single graph to read trends rather than cluttering the UI with multiple graphs of similar nature.

The attached screen displays the hourly average of Requests sent to the API, in a specific time frame, divided by callers. The user can change the data viewed in the top drop-down, or the date.
